Questions
Q: Why are the CTC coordinators getting the survey data, but not the program directors?
A: If there is a signed data release on file, then the IPRC can release them to both the Program Director and CTC Community Coordinator. Those will be sent ASAP.

Q: Do all CTC plans have to be substance abuse plans? Or is it possible to have a need that is not necessarily substance abuse problem, but another problem behavior?
A: At minimum, the plans should address substance abuse. However, given that risk and protective factors are related to other behaviors (e.g., teen pregnancy, anxiety and depression), those outcomes may also be included in your plan.

Q: Is the info for the follow-up exercise coming from our reports?
A: Some of the info will come from your Indiana Survey report. You’ll identify one elevated risk factor using that report. You’ll identify another elevated risk factor from an archival data source. See section 2 of the webinar (Filling the Gaps) and the Risk and Protective Factor Domains and The Indiana Survey* Items crosswalk document for sources of archival data.

FYI
The IPRC ATOD report (often referred to as the Indiana Survey) also contains information on Problem Gambling Behaviors, which may be an indicator for Early and Persistent Antisocial Behavior.

If you have any difficulty with viewing the webinar, contact Roger at morrisr@indiana.edu or 812-855-8336.

If you need your Indiana Survey report or want information about how to obtain a release, contact Susan at Samuels@indiana.edu or 812-855-1237.

Definitions
Subscale – Responses to a group of survey items are aggregated to determine the value of a construct (e.g., risk factor).

Median – If one were to take numerical responses (e.g., survey item responses from several respondents) and put them in order by value. The middle number would be the median.
